

System Galaxy Quick Guide

CONFIGURATION AND OPERATION

GENESIS Time & Attendance

Compatible with GenSQL Database Only

2020 | SG 11 ~~REV~~

K 0Z

2.2 (Step 1) About Installing/Connecting the databases

1. About Installing Genesis: GENESIS SQL database runs on SQL Server 2000.

IMPORTANT: The *Genesis Install Software* may not be able to install a Genesis database (or find the MSSQL Server) if a copy of MSDE is running on the computer.

Refer to Genesis documentation for details on installation conflicts where MSDE is present.

Refer to Genesis documentation for installation procedures on SQL Server 2000.

2. About Installing System Galaxy: the SG 8.1 Install Guide can assist you with specific information on installing System Galaxy. *The Install Guide is found in the manuals folder in the System Galaxy folder in PDF format. It is also on the Install CD and can be run as an HTML in Windows Internet browser.*

System Galaxy can use a common (shared) Database Server or a separate (linked) Database Server depending on your needs.

a) **Shared Database Server: SysGal database can run on SQL Server 2000** and uses an *MSSQL Server connection* to update the Genesis import tables (see Figure 2 in Section 1.3).

b) **Linked Database Server: SysGal database can run on SQL Server 2005 Express** and uses a *Linked SQL Server connection* to update the Genesis (see Figure 2 in Section 1.3).

3. Once the Genesis/System Galaxy installs are complete, the following must be done.

a) If the SysGal and Genesis databases are on the same server, do the following:

- ♦ **Run the Genesis_GCSPROCS.sql script against the Genesis database.** This creates stored procedures that will be used to insert the employee and card swipe data into the Genesis import tables (i.e. IMP_EMPL and IMP_TRAN tables).

b) If the SysGal and Genesis databases are on linked servers, do the following:

- ♦ **On the SysGal database:** run the **AddLinkedServerDynamic sql** script against the SysGal database. This script is located on SG 8.1 Install CD in the following directory: "Components\Genesis TA\Linked Server Files\Run on SysGal DB Server\ ".

IMPORTANT: you must edit the **server (or serverinstance) name** on line 6 of the script before running (put server name inside single-quotes).

- ♦ **On the Genesis database:** Run the **Genesis_GCSPROCS.sql** script against the Genesis database. This script is located on SG 8.1 Install CD in the following directory: "Components\Genesis TA\Galaxy SQL Scripts\Run on Genesis DB Server\ ".

4. After the Database Scripts are finished, the following tasks must be done:

a) **On both servers:** the MSDTC Service must be set to run automatically and started. This is done through the Services Manager in the Control Panel. .

b) **On both servers:** Run the **LinkedSQLServerMSDTCModifications.reg** file to configure DTC. (found on the SG 8.1 Install CD in "Components\Genesis TA\Linked Server Files")

- ♦ This sets the DTC Settings to use options that support linked server interface.
- ♦ It sets the Firewall to allow TCP port 135 and ports 6000 through 6050 for the MSDTC to use.
- ♦ **IMPORTANT: the DTC Security mode must match on both servers.** If you are running on a 2000 Operating System you must use the Security mode = "none".

c) **On both servers:** Manually set the firewall to allow 'sqlservr.exe and sqlbrowser.exe'. This is done through the Windows Control Panel. After opening the Firewall, select the Exceptions tab and add the two program files.

2.3 (Step-2) Setting up the Company in Genesis Software

After the databases have been properly installed and the Genesis_gcsProcs script has been run, the Genesis software must be set up to use the Employee number for the Badge Assignment and with a maximum 10 digit numeric length.

1. Start up and logon the Genesis software (default login “SYSOP” and “password”)
2. From the main menu, select **Configure > Company > Main Company**.
3. In the *Defaults tab*, set **Employee Length to 10** and **Type to ‘numeric’**.
4. In the *Defaults tab*, set Automatic Badge Assignment to **use’ same as employee number’**.
5. Click **[OK]** to save.

Refer to manufacturer’s manuals for details about additional programming in Genesis software.

Figure 3 – Genesis Configure Main Company screen

The screenshot shows the 'Configure Main Company' dialog box with the 'Defaults' tab active. The 'System Fields' section contains a table with the following data:

Field Name	Field Label	Length	Type
Employee	Employee	10	Numeric
Department	Department	10	Numeric
Job	Job	15	Numeric
Step	Step	15	Numeric
Operation	Operation	15	Numeric
Task	Task	15	Numeric

The 'Badges' section shows the following settings:

- Length: 5
- Offset: 0
- Maximum: 5
- Type: Numeric
- Automatic Badge Assignment: Same as Employee Number

Red boxes and arrows highlight the 'Employee' field settings and the 'Automatic Badge Assignment' option.

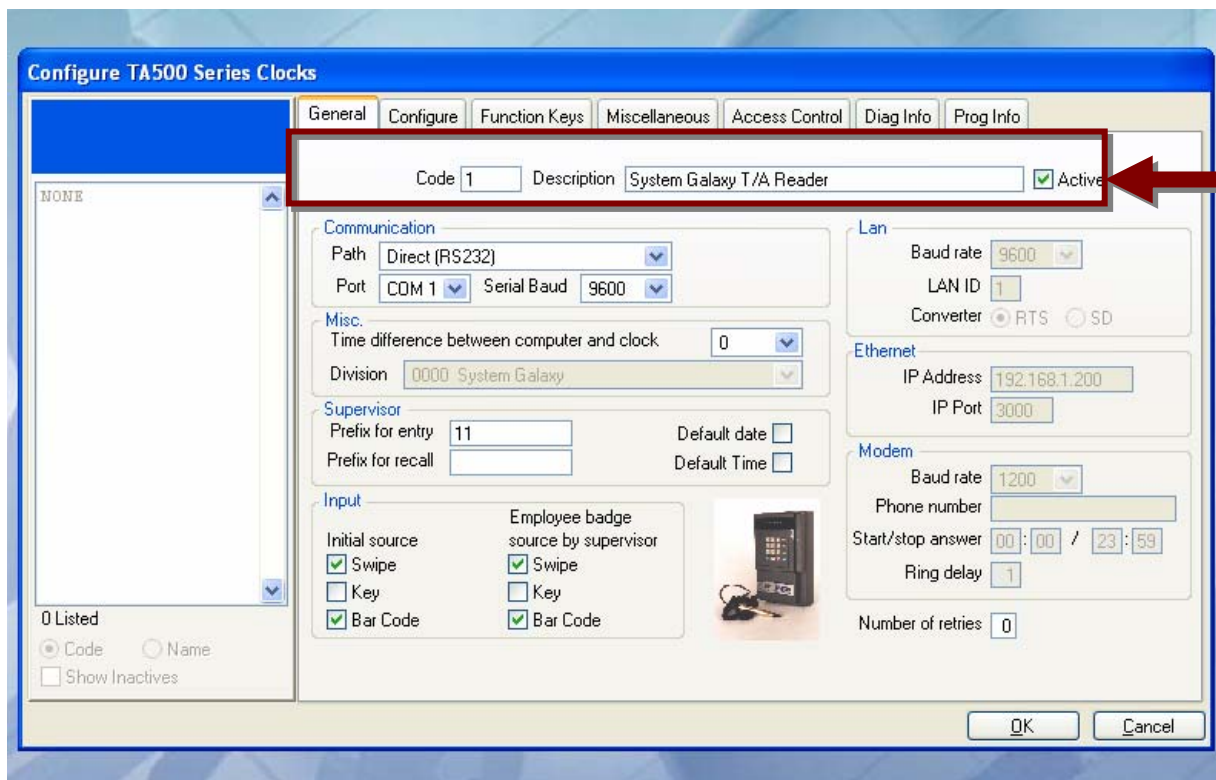

2.4 (Step 3) Setting up clock code “1” in Genesis software

IMPORTANT: System Galaxy uses clock “1” by default when it sends data to GENESIS.

1. Log into the Genesis software
2. From the main menu select the **Clocks > Configure** and choose the desired clock type.
3. On the *General tab*, set the **Code** field to “1” for use with System Galaxy. Refer to manufacturer’s manuals for programming in Genesis software.

IMPORTANT: System Galaxy must use Clock 1 in the system to successfully transfer the transaction data (card read info) from the Time & Attendance reader in System Galaxy.

Figure 4 – Genesis Clock code configuration

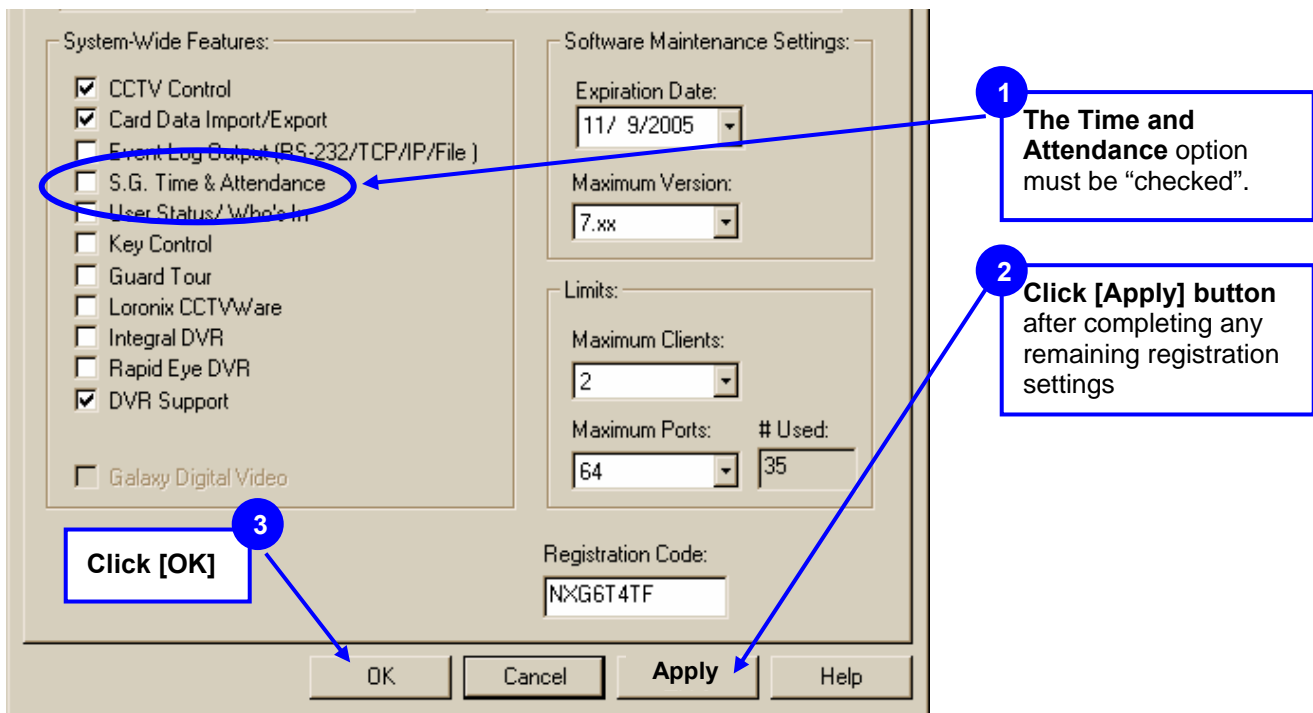

2.5 (Step 4) Register Time & Attendance in System Galaxy

Time & Attendance is available for registration in *Corporate* or *Enterprise* product levels.

- 1) **Open System Registration screen** - from menu options **Configure>Options>Registration>System**.
 - Fill out the necessary fields at the top of the screen
 - Pick the appropriate Product Level (*corporate* or *enterprise* supports time & attendance).
 - Check the “Time and Attendance” check-box** (at the bottom of the list)
 - Complete normal registration process as needed.** See the main SG Software Manual for remaining registration requirements. This includes getting a valid code.
 - Click [Apply] button**
 - Click [OK] button**
- 2) **Perform the Workstation registration for as needed.**
- 3) **Restart System Galaxy** software application after registration is complete.

Figure 5 - System Registration Screen (bottom part) – showing Time & Attendance option

2.6 (Step 5a) Enable Time & Attendance for Shared Server

The Time & Attendance System must be defined and enabled in the Workstation Options Screen.
See Next Section for enabling time and attendance on a linked server

Enabling T/A where SysGal and Genesis use the same database engine/server:

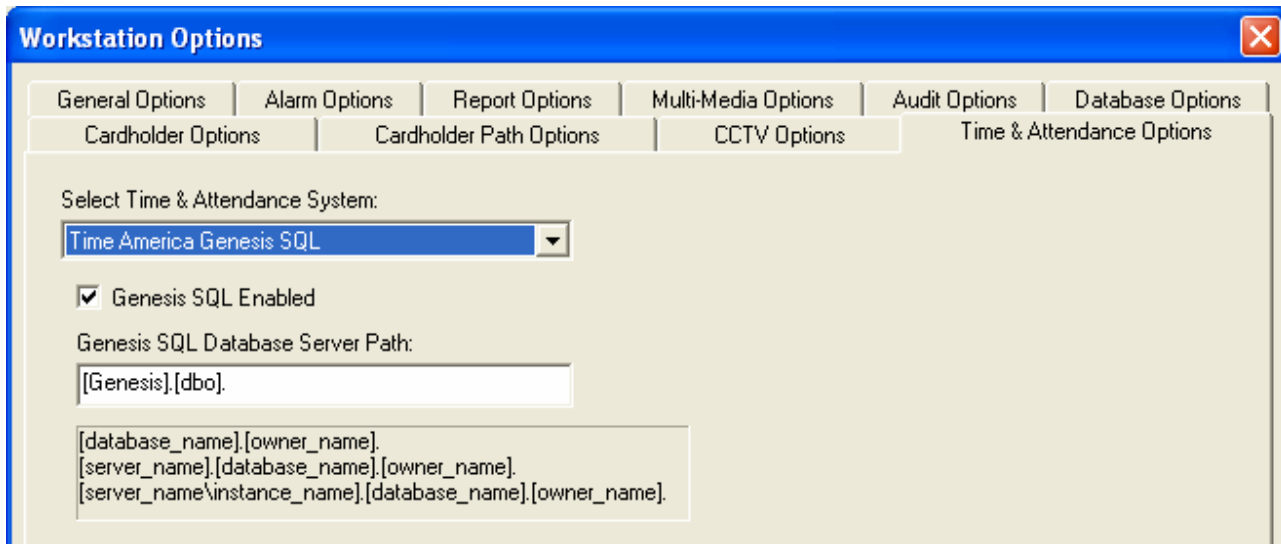

- 1) Open System Galaxy by double clicking the SG Desktop icon and log in as a Master Operator.
- 2) Open *Workstation Options* screen from the main menu: **Configure>Options>Workstation Options**.
- 3) Select the **Time and Attendance** tab (if the time and attendance tab is not displayed, make sure you properly completed the product registration and restarted the software.)
 - a) Choose “Time America Genesis SQL” option in the **Time & Attendance System** droplist.
 - b) Set the **Genesis SQL Enabled** checkbox to “checked”. Employee data will not forward to Genesis database if this option is unchecked. **Note that this option provides the customer with the ability to temporarily stop the updates to the Genesis import tables as needed.**
 - c) Provide the database parameters to the Genesis database in the **Genesis SQL Database Server Path** field. The parameters entered here must match the actual database name and location. Galaxy stored procedures use this parameter to establish the connection to Genesis.

[Genesis].[dbo] is the default value. This should work if SysGal and Genesis databases are on the same server, **and** the Genesis database was installed with the default name of “Genesis” **and** “dbo” as the owner. If a different server, database name or owner is used, you must supply that value in this field. Syntax and spelling must be correct.

Syntax: [server].[database].[owner] or [server\instance].[database].[owner]

If System Galaxy is using a *Linked Server connection*, you can manually enter the parameters here or run the *AddLinkedSQLServerDynamic* script against the SysGal database (see next section for instructions on the script).
 - d) Click **[APPLY]** and **[OK]** button to save changes
- 4) Restart System Galaxy to make changes effective.

Figure 6 – Workstation Options Screen – Time & Attendance tab

2.6.1 (Step 5b) Enable Time & Attendance for Linked Server

- 1) If you know the server name, instance name, Genesis database name and database owner, you can follow the examples provided to manually add the server path. You must use proper syntax (i.e. use square brackets and dots if you are doing this in the Workstation Options screen).

Syntax: [server].[database].[owner] or [server\instance].[database].[owner]

Example: [GenDBserver].[Genesis].[dbo] or [GenDBserver\SQL2X].[Genesis].[dbo]

- OR -

You can run the *AddLinkedSQLServerDynamic* script file against the SysGal database server. This process is outlined in Section 2.2 of this manual.

- 2) **Edit the server\instance parameter on line 6 of the script**, once the file is open in the SQL Manager tool. To find the Genesis server\instance name you can go to the ODBC Manager in the Control panel on the Genesis server and look up the properties of the DSN for GenSQL. If the datasource property indicates a “.” for the server name then you can expand the list to find the local server name.

Line 6 declares the server\instance parameter:

```
set @SERVER_NAME = '[SERVER_NAME\INSTANCE_NAME]'
```

- a) If there is not an *instance name*, **supply the correct server name only** between ‘ ’ single-quotes
 - b) If there is an instance name, **supply the correct server\instance name** between ‘ ’ single-quotes
 - c) **Edit the SysGal database name (only if needed)** wherever referenced in the script. “SysGal” is the default name for the Galaxy database. You can look in the Server Mgt Tool to confirm this.
 - d) **Edit the Genesis database name (only if needed)** wherever referenced in the script. “Genesis” is the default database name. You can look in the Server Management tool to confirm this.
- 3) **Execute the linking script in the management tool:** The results should indicate sp_addlinkedserver '[servername]', SQL server (1 row affected). If you get errors you have not edited the script properly, have the wrong database name, have the wrong server \instance name, or have a connectivity issues.
 - 4) **Open Workstation Options screen** from the main menu: **Configure>Options>Workstation Options**.
 - 5) **Click on the Time & Attendance tab** and **set the system field to “Time America Genesis SQL”**. The Genesis Database Server field should contain the server\instance name you provided in the script.
 - 6) **The Genesis SQL Enabled option must be checked.**
 - 7) **Click [Apply] and [OK] to save. System Galaxy should be restarted to ensure proper operation.**

2.7 Overview of the Time & Attendance Interface

How does System Galaxy (SysGal) Database connect to the Genesis Database?

System Galaxy Time & Attendance interface is designed to send data to the Genesis database using an *MSSQL Server connection* (if both databases are on the same server) or a *Linked SQL Server connection* (if the databases are not on the same server). See Ch. 2

When does System Galaxy send employee data to the Genesis imp_empl table?

Employee Data: System Galaxy sends cardholder (employee) data to Genesis when the Cardholder record is added or updated, if the 'Forward to Time & Attendance' option is "checked" in the Cardholder screen/Personal tab. See Section 3.2 for details about configuring a cardholder for Time & Attendance.

NOTE: The Galaxy cardholder data can be used to jump start the data entry process in Genesis if the System Galaxy Cardholders are programmed first.

When does System Galaxy send transaction data to the Genesis imp_tran table?

Card Swipe/Transaction: System Galaxy stores card transaction data to the SysGal TA_Punches table. This happens when a card gets a 'valid access' at the Reader that is configured to be a Time & Attendance reader. See Section 3.3 for details about configuring a reader for Time & Attendance.

Periodically, a SQL Script/Job sends the transactions from the SysGal.TA_Punches table to the Genesis.imp_tran import table. This script can be run manually or scheduled as a SQL Job in the database management tool (i.e. Enterprise Manager, MMC, etc.). The frequency of the update is determined by the scheduler. See Section 3.4 for details.

How/When does the Genesis software pick up data from the import tables?

The import tables reside in the Genesis database. The Genesis software updates its working database with the data in the import when an operator logs into the Genesis software. Once the Genesis software picks up the data, the import tables are emptied.

The *Employee Details tab* in Genesis displays the cardholder data it gets from System Galaxy.

The *Employee Transaction screens* display the card swipe data it gets from System Galaxy.

2.8 Set up Cardholders to use Time & Attendance in SG

If the 'Forward to Time and Attendance' checkbox is "checked" / enabled in the System Galaxy Cardholder screen, the employee data is sent to the Genesis import table when the record is saved.

There are several ways to add/update a cardholder in the SysGal database: Each of the following methods will automatically trigger the stored procedure to send.

- c) Cardholder screen in System Galaxy - 'Forward to Time & Attendance' must be "checked"
- d) Personnel page in SG-Web - 'Forward to Time & Attendance' must be "checked"
- e) Card Import Utility (external SG Utility program) - must set HT2000 to "1"
- f) 3rd party database connection - must set HT2000 to "1"

IMPORTANT: System Galaxy must use a numeric employee number. The number cannot exceed 10 digits. This is mandated by the Genesis database. Genesis Company should be configured to use max 10 digit employee number. See *Chapter 2 about Setting up the Company in Genesis software.*

Note: Genesis imposes field length restrictions that are shorter than System Galaxy's fields. The System Galaxy stored procedures are designed to truncate data that exceeds Genesis field lengths.

The following fields are forwarded to Genesis:

- Employee Number (numeric only – max 10 digits – must be configured in Genesis software)
- First Name : 20 character length in Genesis
- Last Name : 20 character length in Genesis
- Middle Initial : 1 character length in Genesis (truncated to the first character)
- Address Line1 : 30 character length in Genesis (Personal tab in System Galaxy)
- Address Line2 : 30 character length in Genesis (Personal tab in System Galaxy)
- City : 25 character length in Genesis (Personal tab in System Galaxy)
- State : 3 character length in Genesis (truncated to the 3rd character) (Personal tab in SG)
- ZIP : 7 to 11 digits(Personal tab in System Galaxy)
- Also the Date_Added for the cardholder will be used as the Hire Date in Genesis.

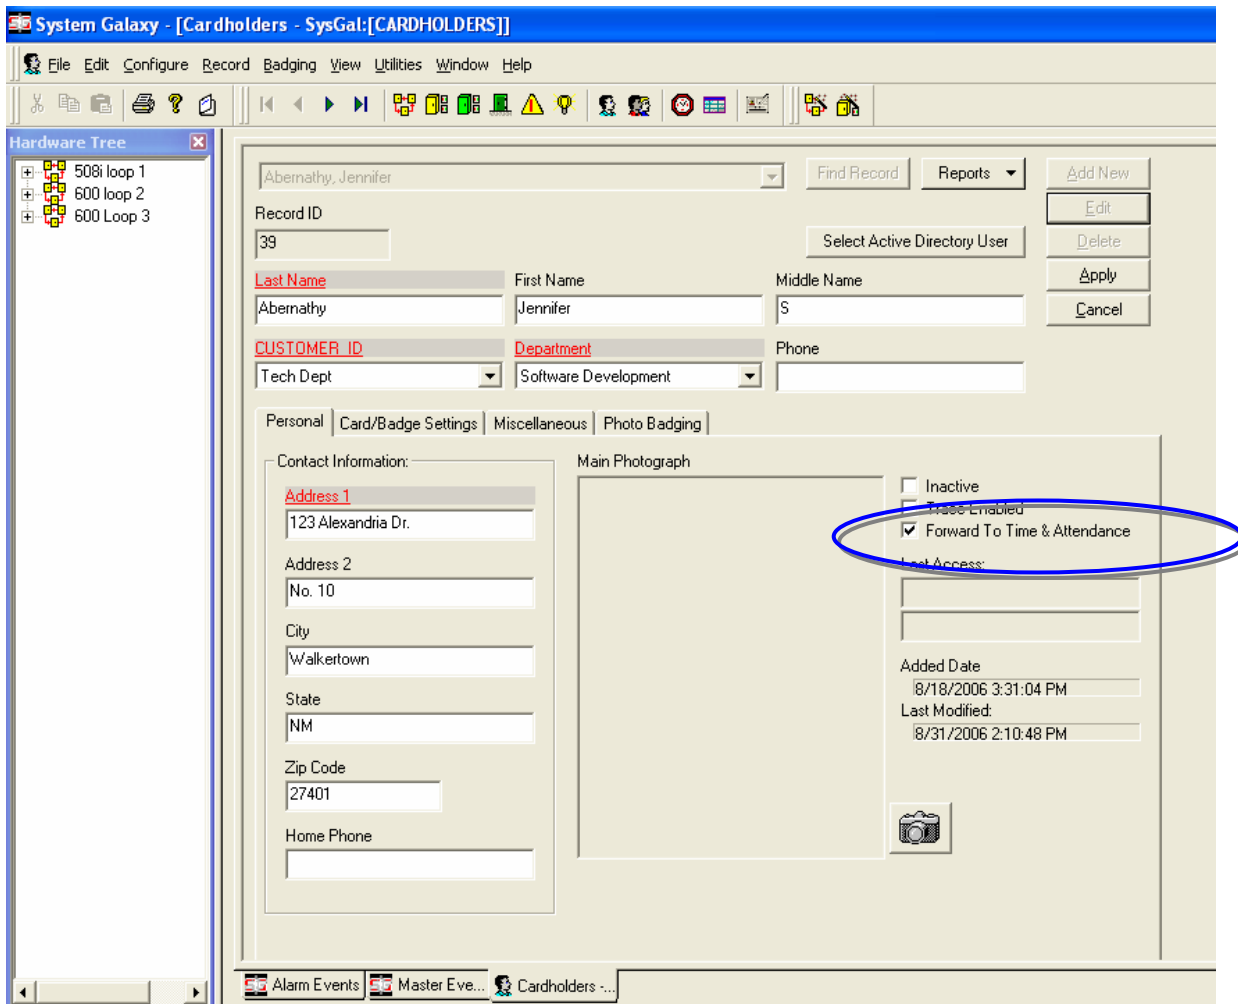

REMEMBER: The user must check the 'Forward to Time and Attendance' option in the Personal tab for the data to be forwarded to the Genesis database. This sets the HT2000 field in SysGal to "1".

2.8.1 Adding Cardholders in System Galaxy Cardholder screen

When a cardholder is saved in System Galaxy and the 'Forward to Time & Attendance' is checked, the the appropriate data is sent to the Genesis system. A save occurs when the user clicks the [Apply] button.

1. From the System Galaxy main menu, click **Configure>Cards>Cardholders**
2. **Type in the cardholder name and personal data** (as appropriate) in the *Personal tab*
3. **Check the 'Forward to Time & Attendance' option** – this identifies this person to be forwarded to the Time and Attendance database.
4. Select the *Card/Badge Settings tab* and **add the employee's card** that will be used at the Time & Attendance (T/A) Reader.
5. Select the Loop Privileges tab and **add the Loop that has the T/A Reader**.
6. **Set the correct access group** so the person can use the reader as needed
7. **Click [APPLY] to save/update the databases**

Figure 7 – Adding Cardholder/Employee data in System Galaxy Cardholder screen

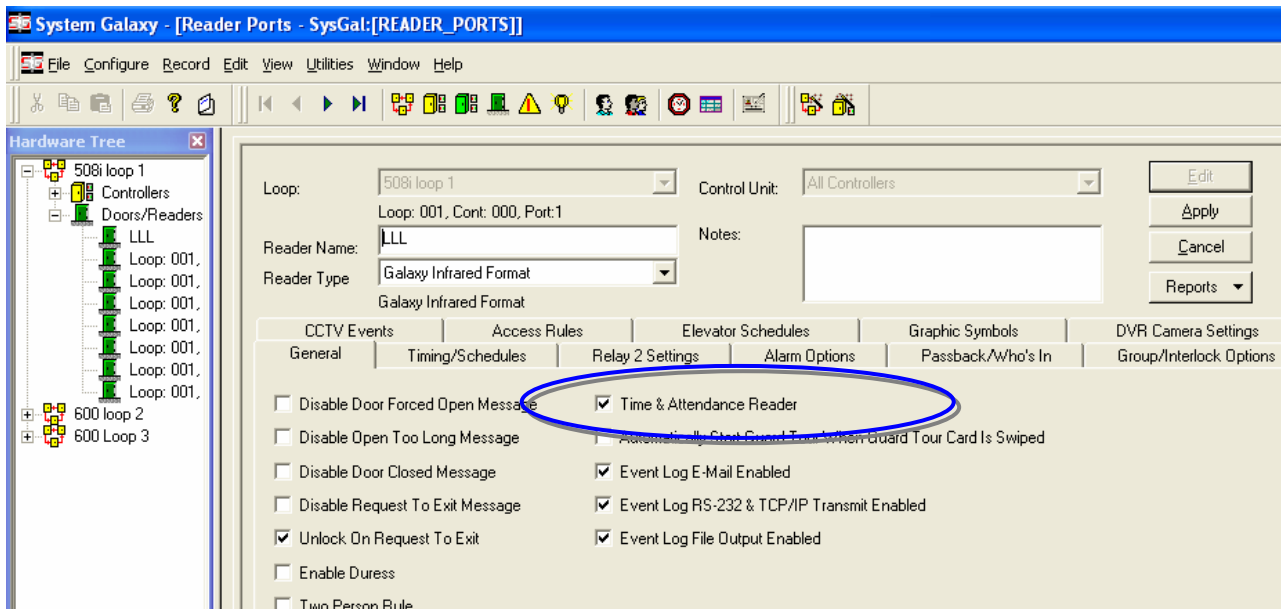

2.9 Set up a Reader in SG to use Time & Attendance

The following steps describe configuring the Time & Attendance Reader options in System Galaxy.

1. **Open the Reader Properties Screen** from the SG Main Menu, by selecting *Configure/Hardware* and choose the 'Doors/Readers' option. << The Reader Programming Screen displays.>>
2. **Select the desired LOOP** from the Loop droplist
3. **Select the desired Controller** from the Controller droplist for the Time & Attendance Reader.
4. **Select the Reader** from the Reader Name droplist.
5. **Click the [Edit] button and Select the *General tab*.**
6. **Enable (check) the 'Time & Attendance Reader' option**
7. **Click the [Apply] button** to save changes. This information is updated to the panel/controller when the changes are saved. In case a delay occurs, the operator can send data to the selected controller using the GCS Load Screen.

Figure 8 - The Reader Programming Screen

2.9.1 Enabling Cypress Clock interface for 508i Controllers

If the Time and Attendance Reader is required to display a time clock synchronized with the reader system, the following must be done. The LCD clock displays used by Galaxy Control Systems connect to an RS-232 converter, which then connects to any secondary controller in the loop. The converter is connected to the J15 connector of the secondary controller – the connector that is used for the PC connection in a Primary controller.

In the Galaxy software, the controller to which the interface is connected must have the Auxiliary COM Port option set to "Cypress Clock". To do so, open the **Controller Properties** window and select the controller. At the bottom of the **Port Types** tab is an area labeled "**Auxiliary Communication Port Options**". Use the "**Mode**" drop-down list to select "**Cypress CVT-1230 Clock Display**". Make sure the "**Broadcast Enabled**" checkbox is **NOT** checked.

2.10 Create a SQL Job to update Reader Transactions

Once the configuration is completed and the necessary employees/cardholders have been set to forward information to Genesis, an SQL job can be set up to periodically update the transactions from the time and attendance reader. When the job runs the card reads and related data are sent to the Genesis import table (imp_tran) and a stored procedure in the Genesis database is triggered to update its transactions.

IMPORTANT: The Genesis software updates its screens with the new transactions when the Genesis user interface application is started up and logged on.

- 1. On the Galaxy Database server:** Copy the following files to the System Galaxy database server. Place them in c:\Program Files\System Galaxy\DBscripts folder and edit them as appropriate.

This file logs into the SysGal database and runs a SQL script to transfer card swipes to the Genesis database. The batch file will put the results txt file in the same directory it is run from.

a) If you are on a shared server with Genesis and/or running on SQL Server 2000:

- ◆ Use TransferTimePunchesToGenesis_osql.bat and TransferTimePunchesToGenesis.sql. This batch file uses the osql.exe to connect to the database. The batch file also needs to be edited to use the correct parameters:

Example: -S **Server-Name** -U **userAcct** -P **password** (where bold replace parameters)

Example: -S **Server-Name** -E (note that E indicates to use Windows Integrated login)

b) If you are on a linked server and running SQL Server 2005 Express:

- ◆ use TransferTimePunchesToGenesis.bat and TransferTimePunchesToGenesis.sql

This batch file uses the sqlcmd.exe to connect to the database. The batch file also needs to be edited to use the correct parameters:

Example: -S **Server-Name** -U **userAcct** -P **password** (where bold replace parameters)

Example: -S **Server-Name** -E (note that E indicates to use Windows Integrated login)

2. **Set up the Windows Task Scheduler to run the TransferTimePunchesToGenesis.bat.**
 - a) **Navigate to the Windows Task Scheduler on the computer that runs the Galaxy (SysGal) database.** From Windows Start button, select Settings >> Control Panel and open the folder named Scheduled Tasks.
 - b) **Click on the “Add Scheduled Task” option** (a Wizard opens), **click [NEXT].**
 - c) **Click [Browse...] navigate to the c:\Program Files\System Galaxy\DBscripts\ folder.**
 - d) **Select the TransferTimePunchesToGenesis*.bat file** (use the osql bat file if on SQL 2000)
 - e) **Select the ‘Daily’ option (recommended) and click [NEXT].**
 - f) **Set the Start Time as desired click [NEXT].**
 - g) **Supply a valid PC user account login and password (blank is not acceptable)**
 - h) **click [NEXT].**
 - i) **Check the Open Advanced Properties checkbox and click [Finish]**
 - j) **Acknowledge the dialog information, and the task’s Schedule window will open.**
 - k) **Select the ‘Schedule’ tab and click [Advanced] button.**
 - l) **Check the Repeat Task checkbox and set the task interval as desired (e.g. 1 minute)**
 - m) **Click [OK] to accept settings and [OK] to save the task.**
 - n) **The task will be added to the Scheduled Tasks window.** Note that you can force the task to run by right-clicking on the task name and selecting ‘Run’ from the menu.

It is a good idea to run some test transactions and swipes when you have finished all the setup to ensure the card reads are going to the Genesis database.

The ability to update Genesis database depends on proper programming/configuration and a functioning IP and SQL Connections to the Genesis database.

If you are running on separate (linked) servers, you should be able to ping the IP Address of the Genesis Server from the System Galaxy server.

3 Troubleshooting Tips

3.1 GENESIS SQL Database will not install

1. Check that the appropriate version of MSSQL Server software is installed on the designated computer. See *manufacturer's documentation for the Genesis software*.
2. Check that a copy (or instance) of MSDE is not installed on the computer designated to run the Genesis database, per Time America requirements. See *manufacturer's documentation*.
3. If upgrading to System Galaxy 8.1: you can run SysGal database on the same computer with Genesis as long as you make sure you are using a compatible database.
 - **Shared Server – upgrading SG 7.x to SG 8.1:** you can migrate SysGal database to the server that is compatible with Genesis, OR you can use a Linked Server Connection and install SysGal on a separate server using the royalty-free SQL2005Express on the SG-8.1 CD.
 - **Shared Server – new install SG 8.1:** you can install SysGal on the database server that is compatible with Genesis, OR you can use a Linked Server Connection and install SysGal on a separate server using the royalty-free SQL2005Express on the SG-8.1 CD.
 - **Linked Server – upgrading SG 7.x to SG 8.1:** you can use Linked Server Connection, migrate /upgrade SysGal on separate server using the royalty-free SQL2005Express on the SG-8.1 CD.
 - **Linked Server – new install SG 8.1:** you can use a Linked Server Connection and install SysGal on a separate server using the royalty-free SQL2005Express on the SG-8.1 CD.

NOTE: Use the *System Galaxy Installation Guide* to help you with the install/upgrade as needed.
4. Refer to manufacturer's documentation for installation of the GENESIS SQL database.

3.2 The Time & Attendance tab is not in Workstation Options

1. Register the System Galaxy software for Time & Attendance in the System Registration screen. See *the section in Chapter 2 of this manual about Registering the SG Time & Attendance*.
2. **Make sure you restarted the System Galaxy software after the registration is complete.**

3.3 SG Cardholders (employees) do not show up in Genesis

Verify the following things in the Genesis Software/Database:

1. Restart the Genesis Employee screen or Genesis software – employees are processed on startup.
2. Verify that the Genesis software is set up to use 10 digit employee number. *See the section in Chapter 2 of this manual about Setting up the Company in Genesis software.*
3. Verify that the Genesis software is set up to assign Badge Number to be 'same as employee'. *See the section in Chapter 2 of this manual about Setting up the Company in Genesis software.*
4. You can query the Genesis IMP_EMPL table to see if the employee has been added to the table. Note that if the employee 10 digit id number is not set up properly, it can cause the employee to not be processed by Genesis. If you had to correct this setting you can invoke a new transfer by editing something pertinent in the Galaxy Cardholder screen and saving it.
5. Verify the Genesis database server is online and not blocked by firewalls and port blocking filters.

Verify the following things for the System Galaxy software:

6. **Verify that the employee is programmed as a cardholder in System Galaxy**
7. **Verify that the cardholder is set up to be forwarded to Time & Attendance** in System Galaxy. *See Chapter 3 - Adding Cardholders for SG Time & Attendance.*
8. **Verify that the employee ID is numeric.**
9. **The SG Time & Attendance feature must be registered.** *See Chapter 2 - Registering Time & Attendance.*
10. **The 'Time America' option is the chosen T/A System** in Workstation Options screen. *See Chapter 2- Enabling Time & Attendance.*
11. **Verify that the Time & Attendance feature is 'enabled'** in Workstation Options. *See Chapter 2 - Enabling Time & Attendance. If this option has been unchecked, employee data will not be transferred.*
12. **Verify that the server/database path is correct** in Workstation Options. *See Chapter 2 about enabling Time & Attendance for Shared server or Linked server (whichever is appropriate).*
13. **Verify that the Genesis database is named "Genesis"** in the SQL Server Management tool.
If the installer did not use the standard database name for Genesis, do the following:
 - a. The database path could be incorrect and should be rechecked (previous step)
 - b. The Stored Procedures may be unable to operate against a unique database name and thus may need to be edited to use the correct database name. Also if you are not using the standard database name for Genesis, call Technical Support.
14. **Verify that the SysGal database is named "SysGal"** in the SQL Server Management tool.
If the installer did not use the standard database name for SysGal, do the following:
 - a. The Stored Procedures may be unable to operate with a unique database name and thus may need to be edited to use the non-standard database name chosen. Also if you are not using the standard database name for SysGal, call Technical Support.
15. **Verify that the appropriate logins are created in the Genesis database.** *See the section in Chapter 2 of this manual about Installing and connecting the databases.*
16. **Verify whether the transactions are inserted in the imp_tran table in the Genesis database.**
17. **Verify whether the transactions are inserted in the TA_Punches table in the SysGal database.**

3.4 Transactions (card reads) do not show up in Genesis

1. Restart the Genesis software – transactions are processed on application startup.
2. Verify that the reader in question is programmed to be a Time & Attendance reader. *See the section in Chapter 3 of this manual about Setting up a Reader to use SG Time & Attendance.*
3. Verify that the Genesis software is set up to allow System Galaxy to use the clock code “1”. *See the section in Chapter 2 of this manual about Setting up the clock code “1” in Genesis software.*
4. Verify that the Time & Attendance feature is registered in System Galaxy. *See the section in Chapter 2 of this manual about Registering the SG Time & Attendance.*
5. Verify that ‘Time America’ is the chosen T/A System in Workstation Options in System Galaxy. *See the section in Chapter 2 of this manual about enabling Time & Attendance at the Workstation.*
6. Verify that the Time & Attendance feature is ‘enabled’ in Workstation Options in System Galaxy. *See the section in Chapter 2 of this manual about enabling Time & Attendance at the Workstation.*
7. Verify that the server/database path is correct in Workstation Options in System Galaxy. *See the section in Chapter 2 of this manual about enabling Time & Attendance at the Workstation.*
18. Verify that the Genesis database is named “Genesis” in the SQL Server Management tool (i.e. Enterprise). If this is not the case the database path could be incorrect and should be rechecked (previous step) or the Stored Procedures may be unable to operate against a unique database name and thus may need to be edited to use the correct database name. *See the section in Chapter 2 of this manual about Installing and connecting the databases.*
8. Verify that the SysGal database is named “SysGal” in the SQL Server Management tool (i.e. Enterprise). If this is not the case the database path could be incorrect and should be rechecked (previous step) or the Stored Procedures may be unable to operate against a unique database name and thus may need to be edited to use the correct database name. *See the section in Chapter 2 of this manual about Installing and connecting the databases.*
9. Verify that the appropriate logins are created in the Genesis database. *See the section in Chapter 2 of this manual about Installing and connecting the databases.*
10. Verify whether the transactions are inserted in the imp_tran table in the Genesis database.
11. Verify whether the transactions are inserted in the TA_Punches table in the SysGal database.

4 Appendix: Keywords and Terms

Table 2 Document Keywords

Keyword/Term	Description
<i>Communication Server</i>	The Communication Server is the PC that hosts the System Galaxy software and GCS Services. It connects/communicates with the Hardware Loops/Clusters (controllers and readers) and the System Galaxy Database (SysGal).
Database Server	<p>The computer where the Database Management System (i.e. MSSQL Server or MSDE) is installed and running along with the actual database(s).</p> <p>NOTE: At the time of this manual's release the Genesis SQL software interfaces with MSSQL Server. Although <i>System Galaxy</i> can interface with either MSSQL Server or MSDE, <i>Genesis SQL</i> may have conflicts installing and running its database if MSDE is present on the server. System Galaxy database can run on the <i>Communication Server</i> under a "full" install with MSDE and use a <i>Linked SQL Server connection</i> to the MSSQL Server that runs the Genesis database. Or the System Galaxy software can run on the Communication Server and the SysGal database can be installed on the <i>MSSQL Database Server</i> (i.e. networked database server install).</p>
GCS	Galaxy Control Systems (acronym).
GCS Services	The Galaxy background services that run on the Galaxy Communication Server (i.e. GCS Client Gateway service, GCS Communication service, GCS DBWriter service, GCS Event service, etc.) . <i>Chapter 11 of the Main Software Manual describes Services in detail.</i>
GCS Client Gateway service	A Galaxy service that supports messaging to and from the System Galaxy client software to the hardware and/or SysGal database. Only one instance of this service can be running within a system and this service must be running for the software to interact with the hardware and database. The GCS Client Gateway should be running on the main Communication Server. <i>Chapter 11 of the Main Software Manual describes Services in detail.</i>
GCS Communication service (Comm Service)	A Galaxy service that supports messaging to and from the System Galaxy client software and hardware and/or SysGal database. Only one instance of this service can be running on a single computer and must be running on the main communication server. If multiple communication servers will be used, an instance of the GCS Comm Service can run on that computer also and will only be responsible for the hardware that is assigned to it. <i>Chapter 11 of the Main Software Manual describes Services in detail.</i>
GCS DBWriter service	A Galaxy service that writes data/events to the SysGal database. Only one instance of this service can be running within a system and this service must be running for the software and hardware to interact with the database. The DBWriter should be running on the main Communication Server regardless of where the database resides. <i>Chapter 11 of the Main Software Manual describes Services in detail.</i>

• System Galaxy Interface to Genesis Time & Attendance

Keyword/Term	Description
GCS Event service	A Galaxy service that handles messaging between the 600 controllers within a cluster and supports the messaging to the SG client software and database . This service should be running to support global event messages between 600 controllers on the same cluster. NOTE: 600 panels will function locally and buffer events until reconnected. The Event Service should be running on the computer that is designated to be the Event Server (this could be the Communication Server or a different computer). <i>Chapter 11 of the Main Software Manual describes Services in detail.</i>
MSDE	Microsoft Server Desktop Engine
MSSQL Enterprise	Microsoft SQL Database Management System
SG	System Galaxy (acronym); Refers to the SG System (its hardware and/or software).
SG WorkStation	The PC that runs to System Galaxy software, but is not the main Communication Server.
