

635-FTS Board Flashing Procedure (via 600/635 Factory Port)

This procedure describes how to flash a **target board** via the Factory port using an **FTS Cable** and the **635-FTS CPU Factory Test Station**. The **FTS-CPU** must be operating at v10.4.9 or higher. The **600-** or **635-model target board** that is being flashed can be a CPU or any Daughter Board. If the *embedded flash* in the FTS-CPU is not the desired *target flash version*, you can upload a *target flash file* into the memory slot.

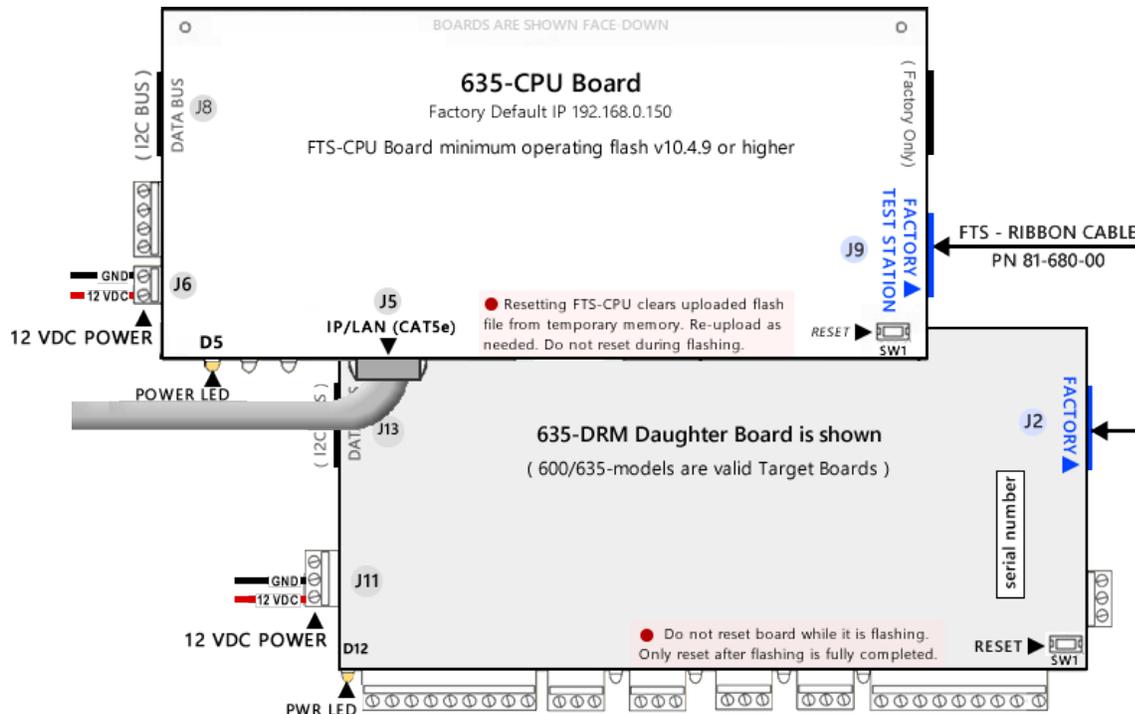

MATERIALS AND REQUIREMENTS

Materials ▼
• Laptop/PC and Cat5e cable
• Galaxy Installation USB drive (with FTS Flash files)
• Factory FTS Cable – PN: 81-0680-00
• 635 FTS-CPU (minimum Flash v. 10.4.9)
• Target Board (600 or 635 model)
• Note: CPU's Panel Status page has links at bottom of page to reach other pages listed herein.

Requirements ▼
1. IP Address of CPU (Default Factory = 192.168.0.150) <i>or you must know the current IP configured in the FTS CPU</i>
2. Provide 12 VDC to the FTS-CPU and Target Boards
3. Must know the Target Flash Version needed (s28 ver. _____)
4. Must know target board serial number, model (600/635) and type.
5. Do not create duplicate serial numbers for boards. Use the <i>serial number</i> (from label that is affixed to the board).

PART 1 - CONNECT AND POWER-UP 635-CPU AND TARGET BOARDS

1. Power up the 635-model FTS-CPU using a 12 VDC power source.
2. Connect 635 FTS-CPU to a Laptop/PC using the *Cat5e cable*.
3. Open the native **Panel Status page** by typing the **CPU's IP Address** into a Browser (default factory IP = 192.168.0.150).
4. Locate the *serial number* on a label on the Target Board (you will need to know this exact number for a later step).
5. Power up the **Target Board** using a 12 VDC power source.
6. Connect the **Factory FTS Cable** to the FTS-CPU 'Factory Test' port and to the **Target Board** 'Factory' port.

PART 2 - DISABLE ALL EVENT SERVERS (VIA THE PANEL WEB PAGE)

7. Click the [Panel Configuration page](#) and uncheck all Event Servers (1 - 4).
8. Click the **Update** button to save settings.

PART 3 - CONFIRM THE EMBEDDED FLASH FILE VERSION

New 635-CPU Boards are all shipped with the 'current operating flash', the native Factory Test Station, and the embedded Flash.

9. Click the [Factory Function page](#) and verify if the *Embedded Column's flash version* matches your *Target Flash Version* ...
 - a) IF the Embedded Column does not match your Target Flash Version, go to **PART 4 – UPLOAD A TARGET FLASH FILE.**
 - b) IF the Embedded Column matches your desired Target Flash Version, go to **PART 5 - FLASHING A TARGET BOARD.**

PART 4 – UPLOAD A TARGET FLASH FILE

10. Go to the [Factory Function page](#) to begin.
11. Click the **Browse button** and find the correct *Target Flash file* by navigating to the appropriate folder path (shown below). You must choose the correct **model number** and **board type** of your target board (600 or 635).
 - ▶ **USB path** X:\\Auxiliary\System Galaxy\FTS635\Factory Testing\S28\ **your_model**\ **your_board-type**\ Previous Version ...\
 - ▶ **PC path** C:\\GCS\System Galaxy\FTS635\Factory Testing\S28\ **your_model**\ **your_board-type**\ Previous Version ...\
12. Select the correct **Flash File** that matches your *Target Flash Version* and click the **Open button**.
13. Click the **[Upload] button** to load the Flash File to the FTS-CPU memory bank.
(*Real-time upload status will display in the Activity Log section of the web page.*)
14. Click **OK button** when the upload is completed. Your *Target Flash Version* will display in the [Uploaded Column](#).

DO NOT RESET THE FTS-CPU BOARD! A reset will delete the target flash file. Reload target flash if needed.

PART 5 - FLASH A TARGET BOARD

15. Click the [Flash Version link](#) that is shown beside the *board type* you want to flash (i.e. 600 or 635 DRM/DPI, DIO, DSI, etc.).
16. When prompted, enter the Target Board **converted serial number**. See examples in *Conversion Chart* below:
 - a) The Serial Number must be exactly 8 digits when it is entered into the FTS prompt.
 - b) You must enter the converted serial number with the format used by the FTS. You must swap a **zero** from the 2nd or 3rd position and place it in the leading position. The serial number label is affixed to the back of the board.

Table 1 Serial Number Conversion Chart:

MODEL	▼ IF BOARD LABEL SAYS THIS	▼ YOU WILL ENTER THE CONVERTED SERIAL NUMBER AT THE FTS	
600 CPU ▶	<i>No conversion needed</i>	"0201 ..."	<i>Enter serial number exactly as seen on the board label.</i>
635 CPU ▶	<i>No conversion needed</i>	"0301 ..."	<i>Enter serial number exactly as seen on the board label.</i>
600 DPI ▶	"2 0 012..." <i>converts to</i>	" 0 2012 ..."	← the zero was swapped from 2 nd pos. to 1 st pos.
635 DRM ▶	"3 0 012..." <i>converts to</i>	" 0 3012 ..."	← the zero was swapped from 2 nd pos. to 1 st pos.
600 DIO ▶	"2 3 001..." <i>converts to</i>	" 0 2301 ..."	← the zero was swapped from 3 rd pos. to 1 st pos.
600 DSI ▶	" 3 3001..." <i>converts to</i>	" 0 3301 ..."	← the zero was swapped from 3 rd pos. to 1 st pos.
635 DSI ▶	" 3 4001..." <i>converts to</i>	" 0 3401 ..."	← the zero was swapped from 3 rd pos. to 1 st pos.

DO NOT DUPLICATE SERIAL NUMBERS! Boards will not function with duplicate Serial Numbers or duplicate Board_IDs.

17. Click the **OK button** to begin transferring flash to your target board.
The Activity Log displays progress indicators that show the *board flash progress* and *flash verification progress*.

NOTE: If the Factory Test Station stops the flashing, check the following 3 things: (1) verify the *FTS Ribbon Cable* is securely attached to the FTS-CPU Factory Test port and the target board Factory port. (2) verify you have uploaded the correct [S28 Flash file](#). (3) make sure you chose (clicked) the correct [Flash Version Link](#) for your target board's *model* and *board-type*. The Factory Test Station will not transfer flash if the selected [Flash Version Link](#) is for a different board than the target board that is connected.

18. When the *Activity Log* displays the message "*flashing is successful*", you will click the **OK button**.
19. Press the **Reset button** (SW1) on the **Target Board only**, to initialize the target board.
Do not reset the FTS-CPU or you will have to reload your target flash file (that was loaded in Part 4).
20. Disconnect the *Factory Test Cable* from the finished Target Board.
See the [System Installation QRS](#) or [635 Hardware Installation Guide](#) for instructions on installing the board, as needed.
21. Connect the *Factory FTS Cable* to the *NEXT Target Board* at the 'Factory Test' port and repeat steps in this section.
 - a) IF your next target board is the same model and type, you can continue flashing with the currently loaded flash. Repeat the steps in this **PART 5 - FLASHING A TARGET BOARD**.
 - b) IF your next Target Board is a different **model** (600 vs 635) or a different **board type** (DSI vs DIO vs DPI/DRM), then you must upload the correct *target file* for this board and model (see **PART 4 – UPLOAD A TARGET FLASH FILE**).
